

Project Development Phase

The development of the **UNESCO World Heritage Dashboard** was carried out in a structured and systematic manner using **Tableau** and a **Kaggle dataset**. The project followed different phases to ensure accurate data analysis and effective dashboard visualization.

Phase 1: Requirement Analysis

The project began by understanding the objective of analyzing UNESCO World Heritage Sites. The main goal was to create an interactive dashboard that provides meaningful insights about heritage sites across different countries, regions, and categories.

Phase 2: Data Collection

The UNESCO World Heritage dataset was collected from **Kaggle**. The dataset contains information such as site name, country, region, category (Cultural, Natural, Mixed), year of inscription, endangered status, and geographical details.

Phase 3: Data Preparation

The collected dataset was cleaned and prepared before visualization. Missing values, duplicate records, and incorrect data were identified and corrected. The dataset was organized into suitable fields to improve analysis and dashboard performance.

Phase 4: Dashboard Development

The cleaned dataset was imported into Tableau. Multiple visualizations were created, including bar charts, pie charts, line charts, maps, treemaps, and KPI cards. Interactive filters and parameters were added to allow users to explore the data based on country, region, category, and year.

Phase 5: Data Analysis

The dashboard was designed to provide insights such as the total number of heritage sites, category-wise distribution, region-wise comparison, top countries with the highest number of heritage sites, endangered heritage sites, and yearly trends. Forecasting was also included to analyze future heritage site trends.

Phase 6: Testing

The dashboard was tested to ensure that all visualizations, filters, and calculations worked correctly. Errors were identified and corrected to improve accuracy, usability, and overall dashboard performance.

Phase 7: Deployment and Documentation

After successful testing, the final dashboard was published and documented. Screenshots, project reports, user stories, sprint planning, and project documentation were prepared for submission. The completed dashboard provides a user-friendly interface for exploring

UNESCO World Heritage data and supports better understanding through interactive visualizations.

Outcome

The project successfully demonstrates how Tableau can transform raw UNESCO World Heritage data into meaningful visual insights. It enables users to analyze global heritage information efficiently, identify important trends, compare regions, and make informed observations through an interactive and visually appealing dashboard.
